

Fire Impact & Risk Evaluation Decision Support Tool F.I.R.E – D.S.T

Oct 2011 - Research Advisory Forum Geoscience Australia Activities

Ian French

Australian Government, Geoscience Australia

RAF Highlights – year to date

NEXIS Whole of Australia Building database

- 1. FIRE-DST NEXIS building data available for Victoria
- 2. NEXIS Case study 1 data available to collaborators
- 3. Discussions with Vic DSE to make an operational NEXIS for Victoria (3rd party licence negotiations underway for all emergency management applications)

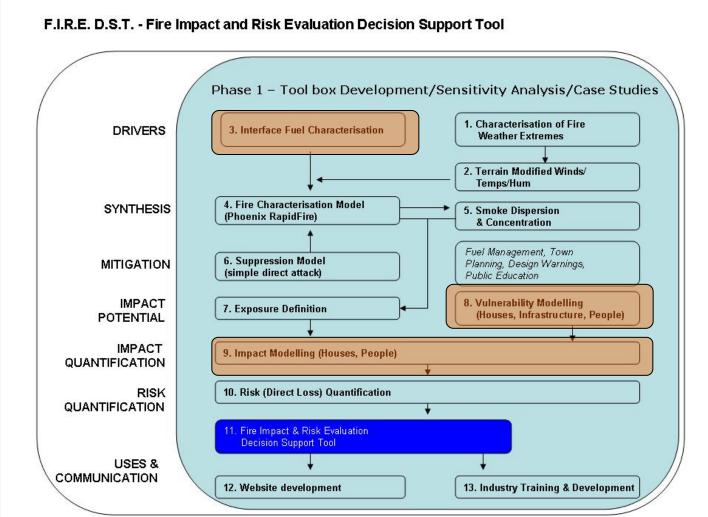

Forest Fuel Model (FFM) (Phil Zylstra)

1. Neighbourhood scale fuel model documented

Vulnerability & Impact Modules in FIRE-DST (Justin Leonard)

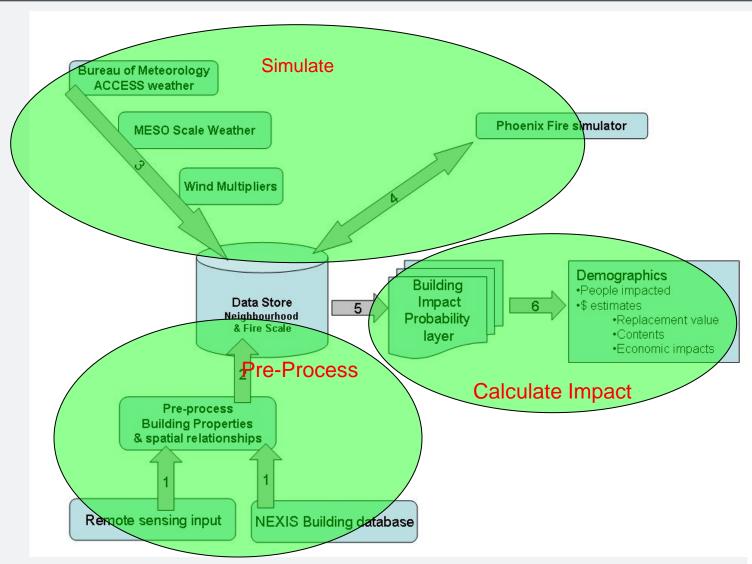

- 1. Vulnerability model specified
- 2. Impact Model specified & document drafted
- 3. FIRE-DST data model for Vulnerability& Impact models document drafted (GA1.1.5)

Information Flow

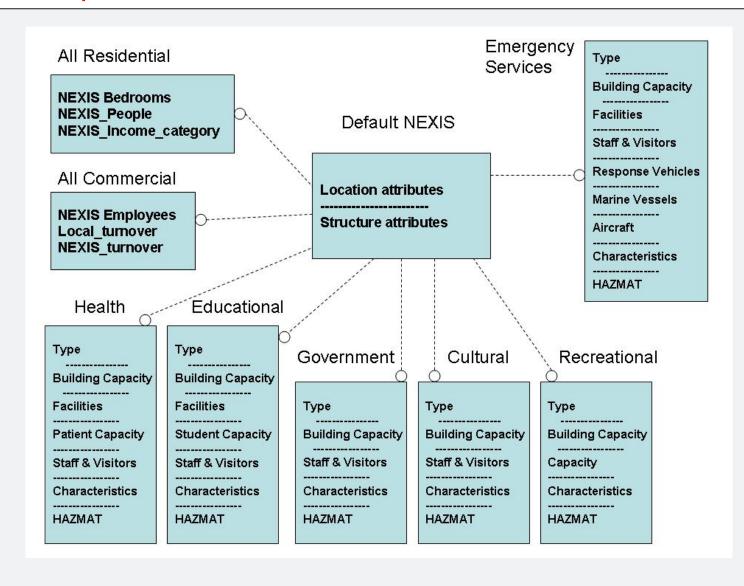

bushfire CRC

Pre-process - Geoscience Australia NEXIS database

Pre-process - Geoscience Australia NEXIS database

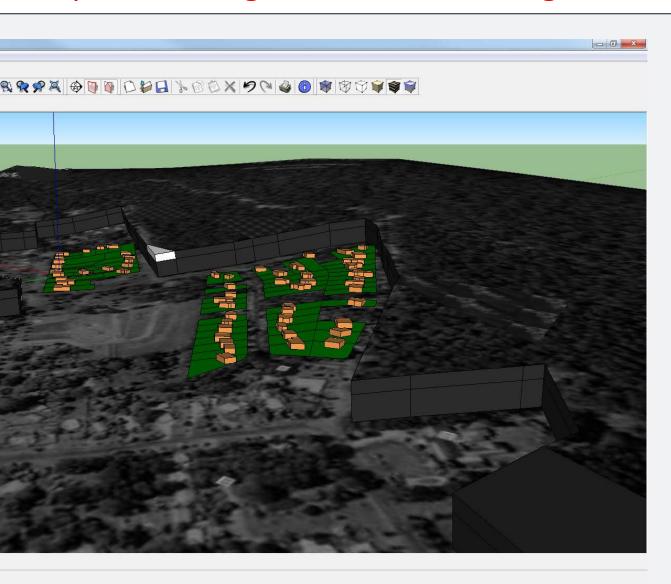

Standard database that can be included in a GIS — with the ability to view and interrogate multiple data layers and satellite images.

Fire Impact & Risk Evaluation - Decision Support Tool

Pre-process neighbourhood and vegetation

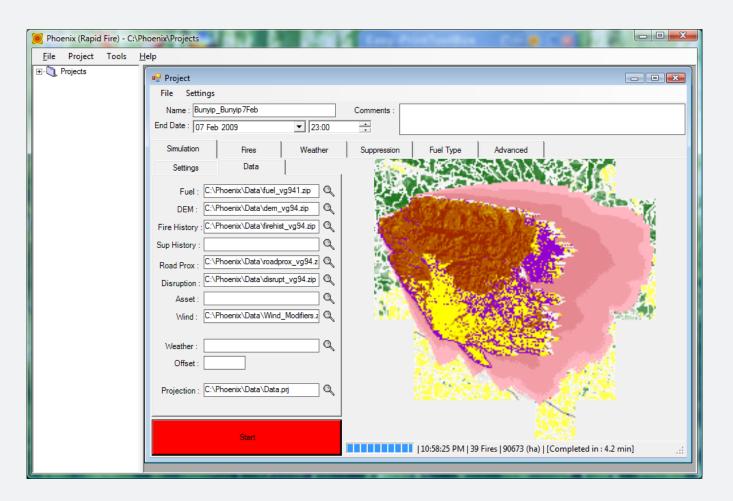

FIRE-DST preprocesses the neighbourhood vulnerabilities for radiation and ember attack by using the local buildings, landscape and vegetation.

Fire Impact & Risk Evaluation - Decision Support Tool

Simulate

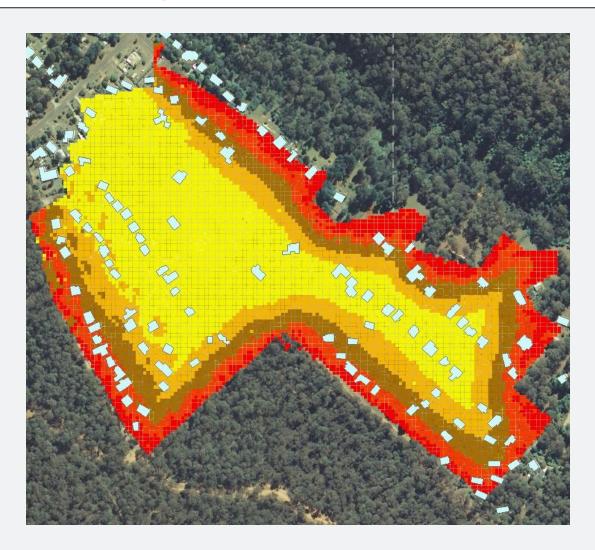

Run fire simulations (using Phoenix) at a landscape scale (180m)

Calculate Impact

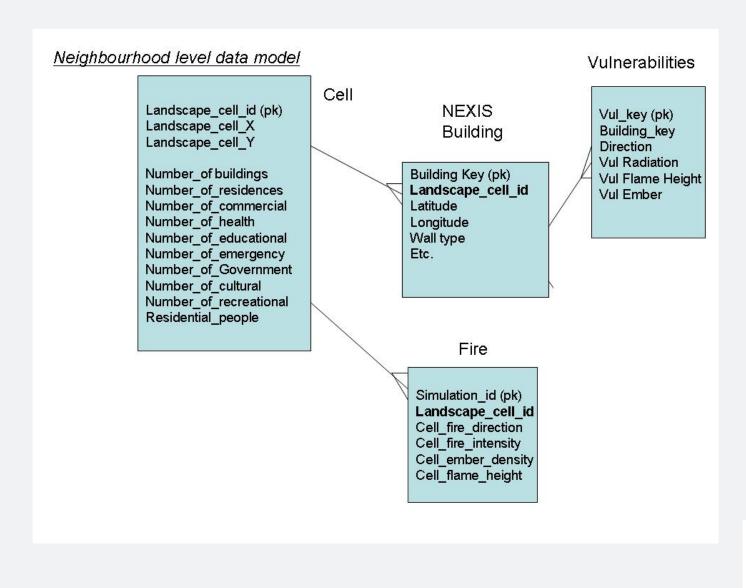

Use the landscape fire details to calculate the probability of impact of that fire.
