MUNICIPAL SERVICES

Winter Burning of Grass Fuels in the ACT

*Adam Leavesley, Jennie Mallela, Neil
Cooper and Dylan Kendall*

Introduction

- La Nina from 2010-2012
- Lots of rain brought lots of grass

Phalaris – 9t/ha

DEPARTMENT OF TERRITORY AND MUNICIPAL SERVICES

Canberra's surrounded by grass

800km of grassy interface

Parliament House

Fuel management zones

- Inner Asset Protection Zone (IAPZ)
- Outer Asset Protection Zone (OAPZ)
- Strategic Fire Advantage Zone (SFAZ)

Urban-rural interface

SFAZ

Under grazing

OAPZ

(Under grazing)

IAPZ

(Mowed)

Fuel management standards

- IAPZ = height <200mm when curing >70%
- OAPZ = GFH <35 when curing >70%
- SFAZ = GFH <50 when curing >70%

GFH = Grass fuel hazard

GFH = % cover x height (m)

High Fuel Loads...

- ... and fuel continuity across the landscape
- An average of 60 burning days/year
- Similar budget to previous years
- **What if we burn in winter?**

DEPARTMENT OF TERRITORY AND MUNICIPAL SERVICES

Fraser – urban-rural interface

Fire ground

Slashed grass

Mulanggari Grasslands

Gungahlin Town Centre

Franklin Early Childhood School

Fraser – urban-rural interface

- ***Phalaris canariensis* (exotic pasture species)**
- **Grows in spring (cool season)**
- **4 paddocks**
- **Fuel load measured 23 July 2012**
- **Burnt 22 August 2012**
- **Measured February**

Mulanggari Grasslands

- *Themeda triandra* (native)
- Grows in summer (warm season)
- 3 paddocks
- Fuel load measured 24 July 2012
- Burnt 3 September 2012
- Measured February

Study design

- **Before-After-Control-Impact**
- **Paddocks divided into burnt and unburnt areas**
- **All areas measured before**
- **Paddocks burnt (impact), and unburnt areas left (control)**
- **All paddocks measured after**

Method

- **5 x 1m² plots per replicate (10 plots /paddock)**

MEASUREMENTS

- **Fuel load (t/ha)**
- **Fuel moisture content (% dry weight)**
- **Grass height**
- **Grass cover (%)**
- **Grass Fuel Hazard = Height (m) x Cover (%)**

Method

- **Cut the grass one paddock at a time (10 plots)**
- **Collect grass curing, cover and height**
- **Weigh grass at CSIRO**
- **Dry at 105° C for 24 hours (Matthews, 2010)**
- **Weigh again**

Analysis

Distribution

- **Kolgomorov-Smirnov test**

Differences

- **ANOVA (normal)**
- **Wilcoxon signed ranks (non-normal)**

Correlation

- **Pearsons (normal)**
- **Spearman's (non-normal)**

Distribution

- Fuel load ($Z = 0.9$, $p = 0.4$)
- Fuel moisture content ($Z = 0.9$, $p = 0.3$)
- **Curing ($Z = 1.4$, $p = 0.04$)**
- Grass height ($Z = 1.2$, $p = 0.1$)
- Grass fuel hazard ($Z = 1.2$, $p = 0.1$)

All normally distributed except for Curing

DEPARTMENT OF TERRITORY AND MUNICIPAL SERVICES

Before – Fuel load

Pasture grass (*Phalaris*)

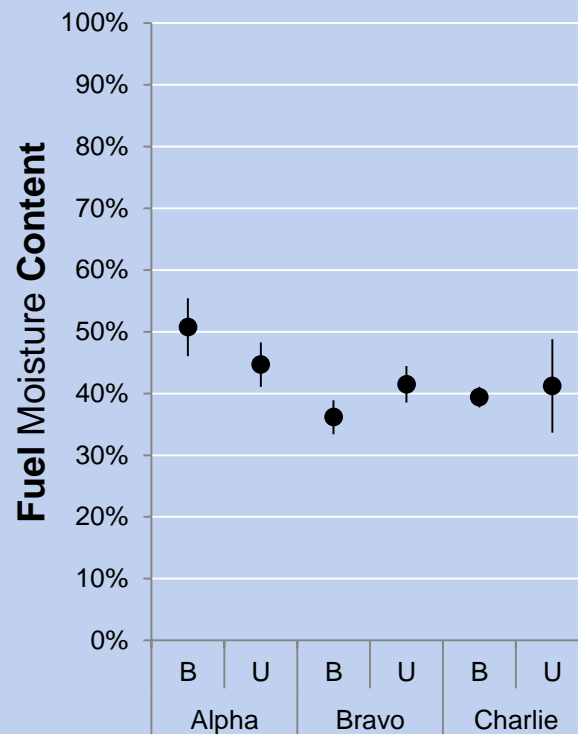

Native grass (*Themeda*)

Before – Fuel moisture content

Pasture grass (*Phalaris*)

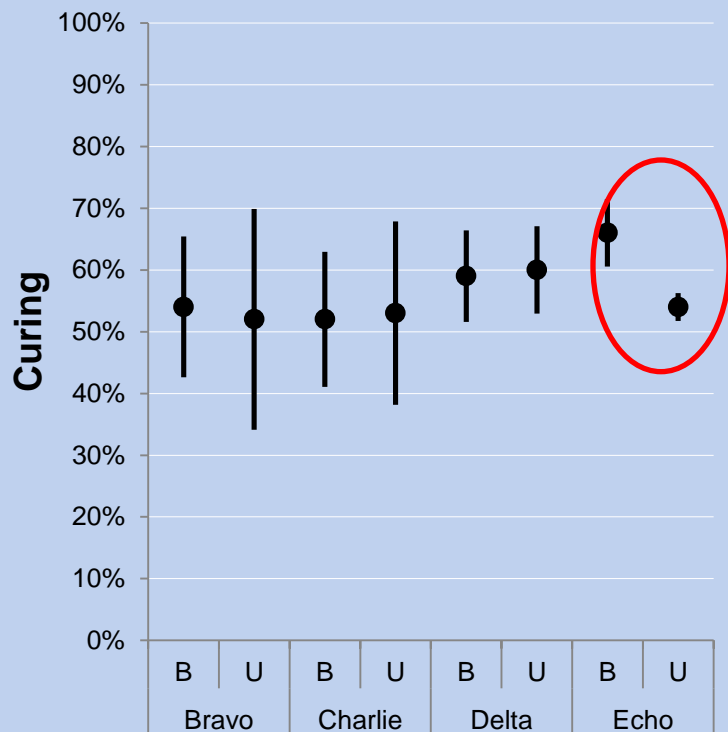

Native grass (*Themeda*)

DEPARTMENT OF TERRITORY AND MUNICIPAL SERVICES

Before – Curing

Pasture grass (*Phalaris*)

Native grass (*Themeda*)

Before – Height

Pasture grass (*Phalaris*)

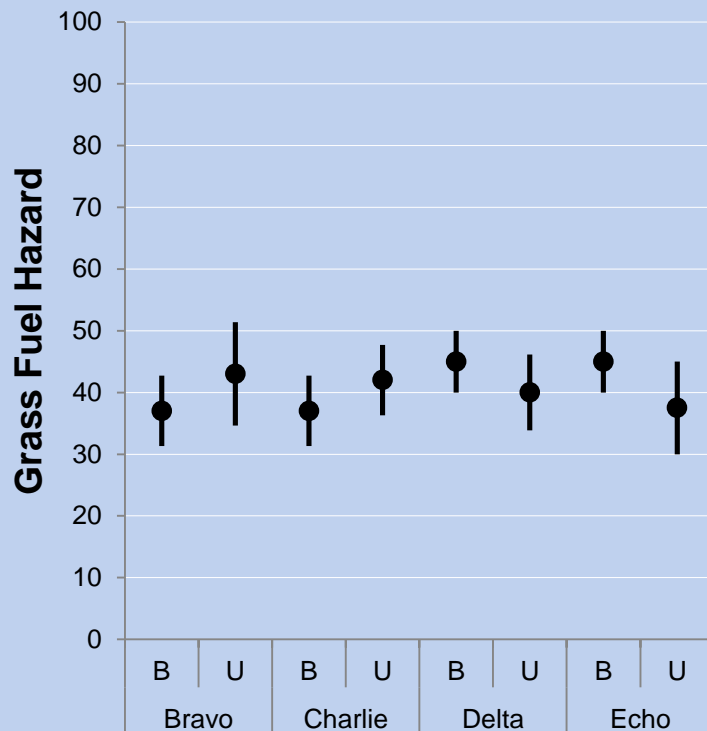

Native grass (*Themeda*)

DEPARTMENT OF TERRITORY AND MUNICIPAL SERVICES

Before – Grass fuel hazard

Pasture grass (*Phalaris*)

Native grass (*Themeda*)

Before - summary

- The experimental units of the same species were not different
- There were differences between species

Phalaris at Fraser

Themeda at Mulanggari

DEPARTMENT OF TERRITORY AND MUNICIPAL SERVICES

Impact - Fraser

- Burnt 22 August 2012

DEPARTMENT OF TERRITORY AND MUNICIPAL SERVICES

Impact - Mulangarri

- Burnt 3 September 2012

After - Fraser

Residue and regrowth 37 days after the burn

After - Mulanggari

Alpha sector control

Regrowth 30 days after the burn

DEPARTMENT OF TERRITORY AND MUNICIPAL SERVICES

After – fuel load

($P < 0.001$)

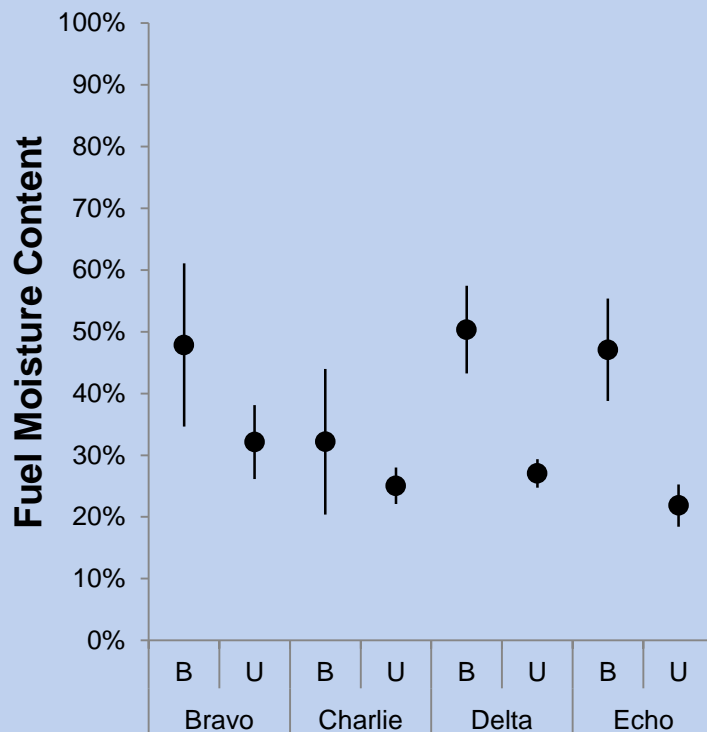

Pasture grass (*Phalaris*)

Native grass (*Themeda*)

After – fuel moisture content

Pasture grass (*Phalaris*)

Native grass (*Themeda*)

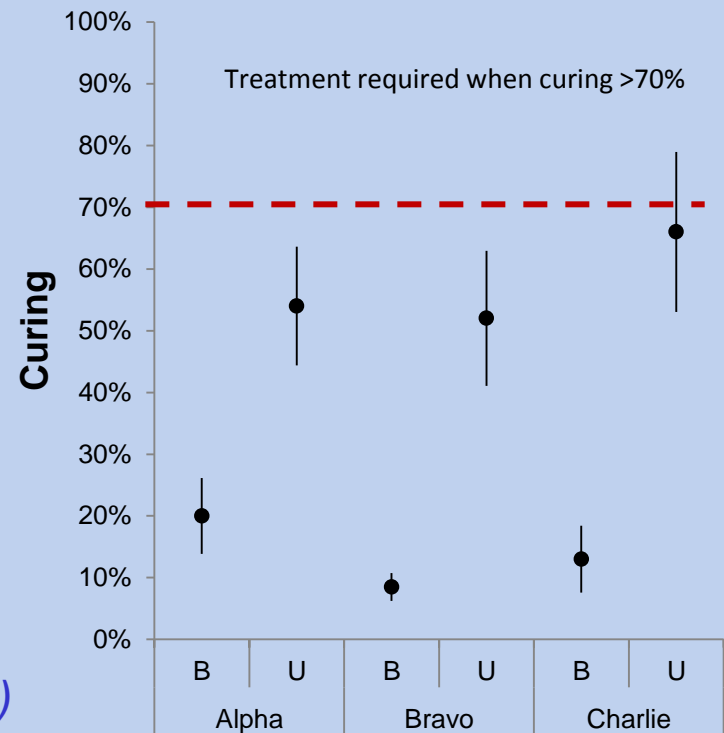

After – grass curing

($P < 0.001$)

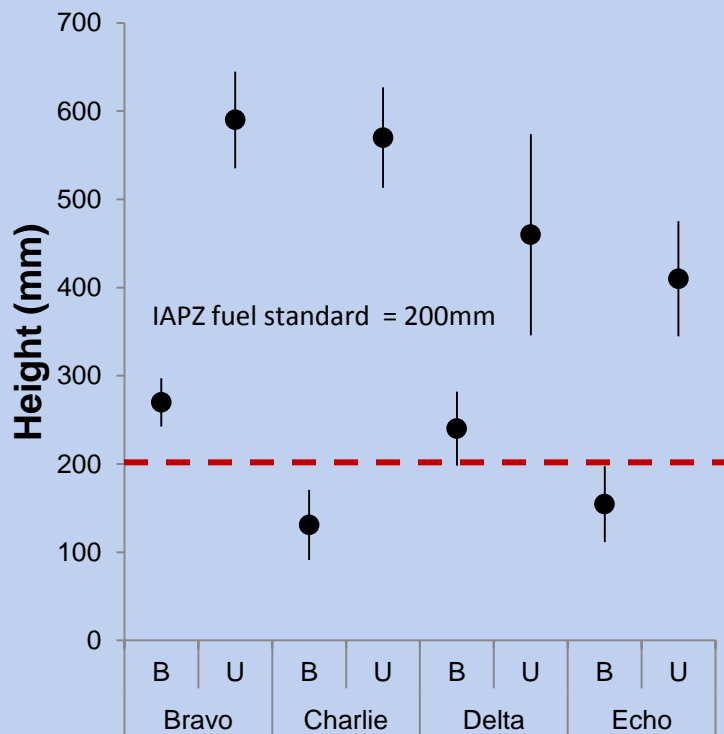

Pasture grass (*Phalaris*)

Native grass (*Themeda*)

After – grass height

($P < 0.001$)

Pasture grass (*Phalaris*)

Native grass (*Themeda*)

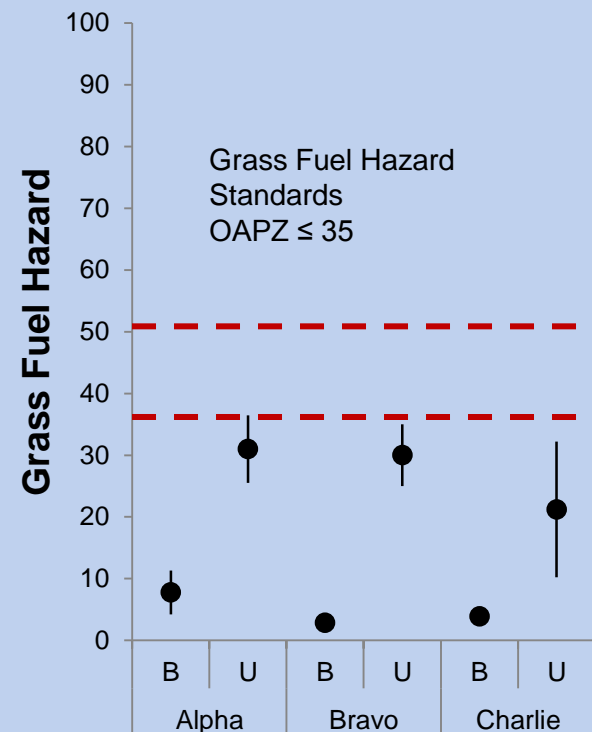

After – grass fuel hazard

($P < 0.001$)

Pasture grass (*Phalaris*)

Native grass (*Themeda*)

Summary

- **It works...**

Late-winter/early spring burning:

- 1) Met the fuel management standards for OAPZ and SFAZ**
- 2) Met the IAPZ standards in native grass**
- 3) Marginally failed the IAPZ standards in *Phalaris***

Correlations

- Question:
- How do the observations compare to the measurements?

Correlations

Fuel load and GFH

Fraser - *Phalaris*

($r = 0.7$, $N = 80$, $p < 0.001$)

Mullangari - *Themeda*

($r = 0.9$, $N = 60$, $p < 0.001$)

Correlations

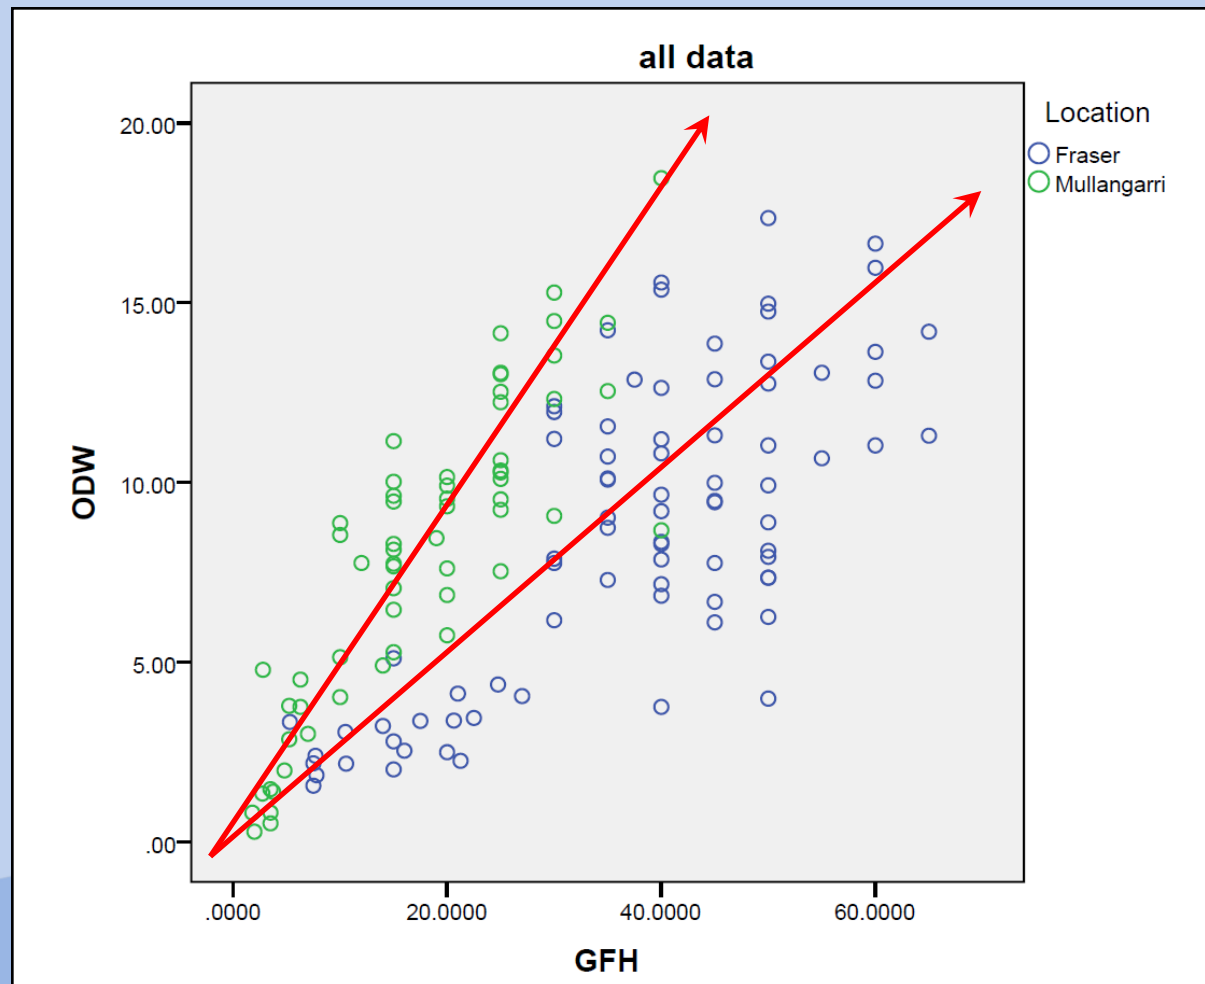

Fuel load and GFH

Fraser - *Phalaris*

($r = 0.7$, $N = 80$, $p < 0.001$)

Mullangari - *Themeda*

($r = 0.9$, $N = 60$, $p < 0.001$)

Correlations

Fraser - *Phalaris*
($R_s = -0.6$, $N = 80$, $p < 0.001$)

Mulanggari - *Themeda*
($R_s = 0.3$, $N = 80$, $p = 0.007$)

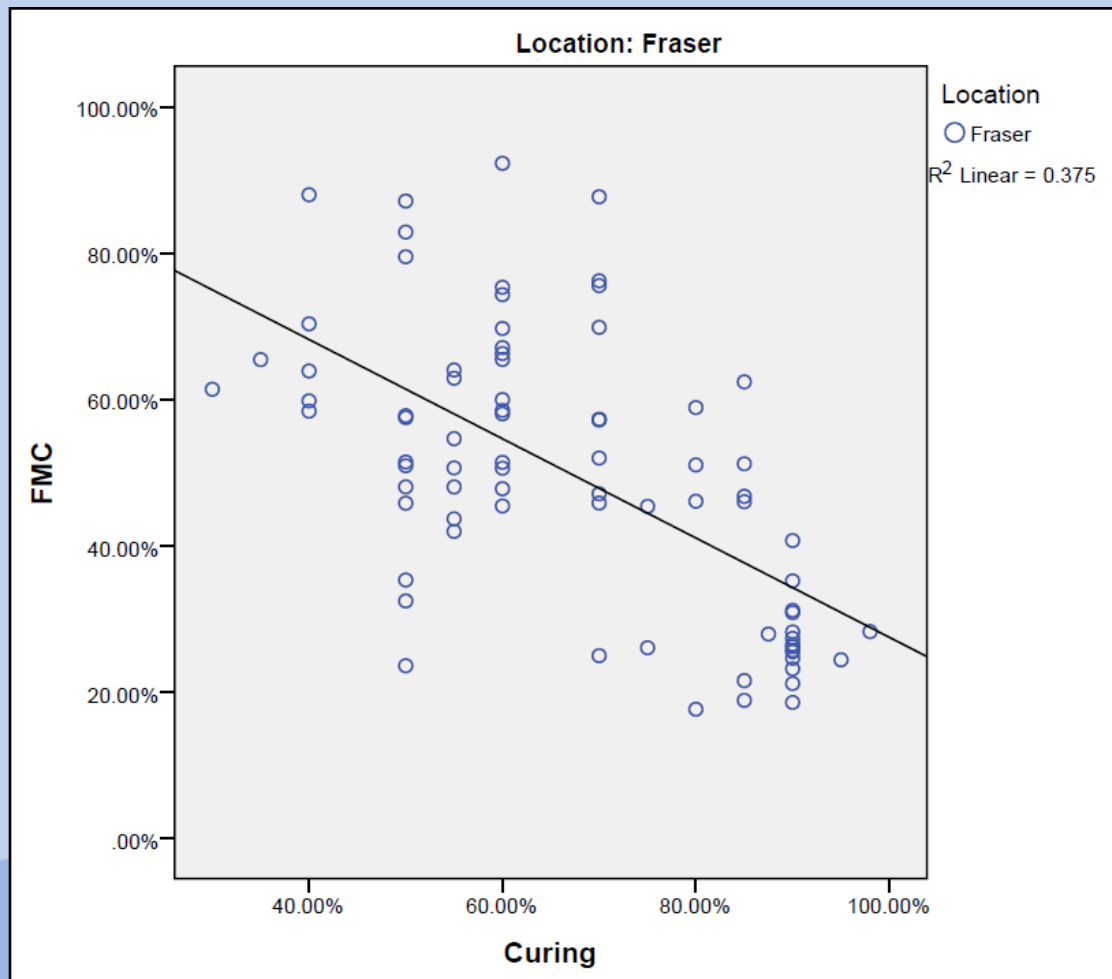

Correlations

Fuel load and GFH

Fraser - *Phalaris*
($r = 0.7$, $N = 80$, $p < 0.001$)

Correlations

Fuel load and GFH

Mulanggari - *Themeda*
($r = 0.9$, $N = 60$, $p < 0.001$)

Summary

- 1) *Themeda* fuel loads can be as high as *Phalaris* even though they don't look it.**
- 2) The FMC of *Themeda* is not necessarily well represented by curing.**

Acknowledgements

Thanks to:

CSIRO Bushfire Dynamics for use of the kiln and helpful discussions.

My colleagues in the fire crews for all the cutting and burning.
